STRATEGY · 2027–2029

AI & PropTech Strategy — the 10× plan

Where 3 PIN stands against the best AI-native brokerages and proptech products, and what to build, in what order, with the money, the business effect and the agent time for every initiative.

Written 14 Oct 2026 from a review of the best AI-native brokerages and proptech products in the world and in India, the Chennai market, and the platform 3 PIN already runs. It replaces the earlier roadmap, which listed ideas without saying what each one changes. Every initiative here states **where we are, what we introduce, why, what happens the day after, how to build it on what exists, the money, the business effect, the agent time, the risks, and the number that proves it worked**. Figures marked *assumption* are to be replaced with the Finance console's own numbers; the model in section 8 shows how. Sections 12–15 add **Eåsy by 3 PIN** (the personal AI staff for every user), the bets that rule the sector, the next chain of business — joint ventures, construction and redevelopment — with the one-year case, and the international watchlist with the ideas untouched in Chennai.

1. The thesis in one page

The brokerage of 2027 is an AI-native company with agents in it, not an agency that bought AI tools. The proof is already public:

- SERHANT.'s S.MPLE platform has completed 54,000+ requests for 2,000+ agents, returned ~28,000 hours of admin work, and agents who joined and adopted it raised their commission income **144 % year on year** against their previous firm. S.MPLE 2.0 (October 2026) adds **Dot**, an "AI chief of staff" that reads the agent's calendar, email and CRM and *starts work before being asked*, coordinating 70+ specialist agents (CMAs, listing presentations, campaigns, transaction coordination, compliance, follow-up).
- Compass agents report **15–20 hours a week** given back by an AI assistant that lives inside their pipeline and executes admin work. Zillow's **AI mode** (March 2026) lets buyers search by describing the home and takes real steps for them (tours, agent contact).
- In India, NoBroker crossed **₹1,000 crore** revenue, runs rent collection and property management at 8–10 % of rent, and launched ConvoZen.AI for voice conversations; MagicBricks' READPRO AI CRM is on **85,000+ broker licences**; Housing.com prices **10 million** properties live. Landeed verifies ownership and documents with AI across states.
- The economics are known: a lead answered within 5 minutes converts **8–9× better** than one answered in an hour; sub-90-second WhatsApp replies lift site-visit conversion to **25–30 %** against 5–10 %; Indian brokers who follow a structured, AI-assisted system close **4–6 %** of leads, the best **8–10 %**, against an average of 1–3 %.

3 PIN's position is unusual for a Chennai agency: the data pipeline that most brokerages lack is **already built** — chat intake, a real pipeline with milestone dates, a matching engine used in three consoles, a

shoot-to-post media tracker with per-outlet cuts, a ledger per deal. What is missing is the layer that *acts* on it, the channels that *reach* buyers and sellers at scale, the media formats buyers now expect, and the recurring revenue lines that make a brokerage worth 10× more than its commissions.

10× is not a slogan here; it is three multiplications. Deals per lead ×3 (speed-to-lead, matching, follow-up that never lapses) · leads and listings ×2 (sourcing engine, distribution, content) · revenue per client ×1.7 (exclusive listings, loans, rentals, management, referrals). 3 × 2 × 1.7 ≈ 10, over 24–30 months, at the agent headcount of today.

2. What the leaders do, October 2026

Who	What they built	Why it matters for 3 PIN
SERHANT. — S.MPLE 2.0 / Dot	An agentic layer over the agent's whole business: proactive daily work, 70+ agents, CMAs, listing decks, marketing campaigns, transaction coordination, compliance, follow-up. 144 % GCI uplift; ~28,000 hours returned. Built for fast iteration (Vercel), exactly 3 PIN's stack	The model to copy for the back office: a chief of staff that *starts* work, with a person approving. 3 PIN's Daily task and AI queue are the seed
Compass — AI Assistant / Compass One	Assistant inside the CRM: daily briefings, likely-to-sell flags, record updates, follow-up drafts, transaction management; a client portal for every stage. 15–20 h/week saved	Briefings and a buyer/seller portal ("My 3 PIN") are cheap for us because the data already exists
Zillow — AI mode, Showcase	Conversational search ("3BHK near a metro, east facing, under 1.5 Cr"), guided next steps, immersive listings (3D, floor plans, staging)	Buyers will expect to *talk* to inventory. Our match engine + inventory can answer on WhatsApp today
NoBroker	Owner-direct model, rent collection, property management (8–10 % of rent), interiors, loans, packers; ConvoZen voice AI; ₹1,000 cr revenue	Shows the recurring-revenue lines a brokerage can add; also the competitor that removes brokers unless we add value they cannot
MagicBricks READPRO, Housing.com AVM, 99acres	AI CRM to 85k brokers; 10 M live valuations; AI recommendations from budget, commute, behaviour	Portals are turning into platforms. We must syndicate *and* own the relationship with a price opinion portals cannot give for Chennai micro-markets
Landeed / Zapkey	AI reading of sale deeds, EC, patta, mutation, survey maps; registration data; legal opinions; loan-readiness	A "3 PIN Verified" badge is buildable in months, not years
Giraffe360, Apply Design, Gaussian splatting (Insta360 X6, Matterport, Realtor.com)	One visit → HDR photos, LiDAR floor plan, 3D tour, video, staging, property site. Photoreal walkthroughs from a phone or 360 camera; staging of 10,000 homes a month by one app	The shoot can produce ten assets instead of two, at the same cost
AI voice agents in India (Tamil-capable)	Qualify, score, book the visit, WhatsApp the confirmation; response time 4 h → under 60 s; 3× qualification rate; after-hours leads convert	TailorTalk covers chat; the phone channel is open
SmartZip / Offrs / Likely.AI	Predict who sells in 6–12 months from 250+ signals; ~72 % accuracy; automated outreach	The same idea works on *our own* event data plus Chennai public records
Generative-engine optimisation	67 % of surveyed buyers used ChatGPT/Gemini/AI Overviews before contacting an agent; real estate ranks last in AI visibility (0.14 % AI Overview trigger rate)	An open field: locality guides and verified facts in Tamil and English get us *cited*
SM REITs / fractional ownership	₹2,300 cr (2021) → ~₹9,800 cr (2026); SEBI-regulated; ₹10 lakh tickets; 8–10 % yields	Not a business to build; a product to distribute to our investor buyers

Chennai, 2026: ~7,200 units sold in Q1 (+10 % YoY), 6,500 launched; average asking ₹9,200/sq ft; ₹4,000 (outer) to ₹22,000 (Adyar/Besant Nagar); 3BHK demand +15 %; mid-segment (₹50 L–1 Cr) is 45

% of sales, premium (>₹1.5 Cr) 20 %; prices up 6–12 % in a year. Meta cost per qualified lead ₹300–1,500 in metros.

3. Where 3 PIN stands — honest scorecard

Status is taken from the Process Atlas (the live platform at commit `b48bfaa`).

Area	Today at 3 PIN	Best in class	Verdict
Sourcing sellers	Owners come to us (WhatsApp/Instagram/website chat), the AI re-tags confident sellers, a card is made automatically. Nothing finds owners *before* they decide	Predictive seller scoring, owner outreach, co-broking networks, portal scraping	**Gap — biggest growth lever**
Onboarding & listing	Listing type, documents checklist, brochure v1/v2, mapping by hand; owner approval gate not enforced	WhatsApp-native intake, document AI, instant price opinion, e-signed exclusive agreement	**Partly**
Showcasing	Photos, video, drone, floor plan, tour as checklist; per-outlet cuts and V/O; brochure by pipeline	3D/splat tours, virtual staging, AI narration in Tamil, avatar presenters, property microsites	**Behind on formats, ahead on process**
Distribution	Instagram/FB/YouTube posts confirmed with URL; 99acres and website by hand	Portal feeds, own GEO-optimised site, WhatsApp channels, matched-buyer push	**Gap**
Attraction & influence	Owner's content, week plan pasted into Posting; attribution not measured	Founder-led content engine with measured leads per post; creator collabs; newsletter	**Partly**
Lead matching	One engine across CRM, dashboard and board; vetoes; "Properties for this buyer"	Behavioural signals, conversational search, auto-outreach on new stock	**On par / ahead**
Speed-to-lead & conversion	TailorTalk replies on chat; calls not captured; follow-ups rule-based; AI stage placement	<60 s on every channel incl. voice, 24×7; call → notes; deal score; next best action	**Gap on phone, par on chat**
Site visits & buyer experience	Visits with calendar invitations to agents; feedback captured on return	Visit pack to the buyer, virtual-first tours, buyer portal, offer assistant	**Partly**
Transaction & closing	Finance deal, invoices, GST, token	AI transaction coordinator, e-sign, KYC, registration tracking	**Gap**
After-sale & recurring revenue	None (sold = removed from matches)	Rentals, management, loans, interiors, annual value reports, referrals	**Gap — biggest revenue lever**
Agent back office	Daily task, digests at 08:00/09:00/21:30, mentions	Chief-of-staff AI that drafts, books, updates and reports; voice commands	**Gap**
Data & intelligence	Rich event data held, mostly unread by any AI (signals log, milestone dates, undo history, price edits)	Fact store, price desk, attribution, self-auditing AI	**Gap, cheap to close**

4. The operating model to build: "3 PIN Autopilot"

Three layers, each built on something that exists:

1. **Fact layer** — a nightly fact store (one compressed document per topic: leads, properties, deals, posts, visits) plus a Chennai price desk and demand map. Every AI reads facts from here, never raw collections (quota, speed, consistency). Exposed to Claude/ChatGPT through an MCP server, so the owner can ask any question about the business in plain Tamil or English.
2. **Agent layer** — supervised specialist agents (sourcing, seller intake, media, outreach, follow-up, transaction, finance) run by one coordinator, **Eåsy by 3 PIN**, the personal AI staff every user gets (section 12). Eåsy starts work proactively (as Dot does) and puts anything consequential into **one approval queue** the owner clears from the phone. The CRM's existing AI queue, suggestions and 7-day undo are the seed.
3. **Channel layer** — WhatsApp (TailorTalk, Flows, channels), Instagram, a phone number answered by an AI voice agent in Tamil and English, the website and "Ask 3 PIN" on ChatGPT, and portal feeds. Every channel writes to the same lead, the same card, the same fact store.

Rules that never change: a person approves Won, listings going public, agreements, prices and first contact with a new person; every AI action is logged and undoable; nothing reads customer data for a purpose it was not collected for; AI-made visuals are labelled.

5. The plan by area

Effort: **S** weeks · **M** 1–3 months · **L** a quarter or more. Money is per year unless said. "Agent time" is hours per agent per week.

A. Sourcing — find the seller before they decide

Current status. Listings depend on owners contacting us. The Sellers view shows who is waiting for a card; there is no "where found" field, no shortlist stage, no outbound sourcing. Growth in listings equals growth in inbound chat volume, which costs ad money.

What we introduce.

#	Initiative	Effort	What it is
A1	**Likely-to-list engine**	M	A score per known owner and past contact from our own events (rent-out enquiries 11+ months old, tenants whose lease ends, buyers who bought 7–10 years ago, sellers who paused, owners whose property we marketed for rent) plus public Chennai signals (new registrations by locality from registration data, guideline-value revisions, aging rental listings on portals, new society handovers, NRI-owned flats). Transparent weights; recalibrated quarterly
A2	**Owner outreach autopilot**	M	For every high-score owner, Eåsy drafts a personal WhatsApp or call script in Tamil/English with a *locality price note* ("flats like yours in Anna Nagar sold at ₹14–18k/sq ft this quarter"); the agent approves and sends; replies flow into the normal pipeline. TRAI-compliant: no cold AI calls, opt-in first
A3	**Co-broking and portal feed**	S	Daily ingest from co-broking networks (CoClose has 1,500+ Chennai listings; Brokers Blok) and owner-direct portals into a "sourcing inbox"; AI de-duplicates against inventory, scores fit against open buyer demand, and proposes who to call
A4	**Referral engine**	S	After every visit, deal and rental, a WhatsApp Flow asks for a referral with a one-tap share card; referrers get a tracked thank-you (and a reward where lawful). Every referral is attributed
A5	**Demand-led sourcing targets**	M	The demand–supply gap engine (open buyer requirements vs stock by locality, budget and configuration) produces a weekly "find 3 × 2BHK in Velachery under 90 L" list for agents, with the exact buyers waiting

Why. A brokerage's growth ceiling is listings, not buyers. Predictive sourcing is now a mature category abroad (72 % accuracy at 6–12 months); nobody in Chennai does it with owned data. Our demand data tells us *which* properties to find, which makes every outreach credible ("I have four buyers for this").

What happens the day after. Each agent's Daily task gains a "Sourcing" section: five owners to contact with the script ready and the buyers waiting named. The Sellers view gets a *Prospect* column before *Waiting for a card*. The owner sees a weekly "listings pipeline" number for the first time.

How to build. A1 is a scoring module over the fact store (section K) plus two public-data fetchers; A2 reuses the follow-up drafts and WhatsApp templates; A3 is an ingest job plus the existing duplicate detection and match engine; A4 is a WhatsApp Flow and a `referredBy` field already implied by the lead model; A5 is a report over existing match vetoes and requirements.

Financial impact (assumption-based, section 8 model). +25–40 % listings in year one at near-zero ad cost; each exclusive listing is worth two sides of brokerage. With 131 properties today, +40 listings a year at a 30 % sell-through and ₹1 Cr average ticket at 1 % per side ≈ **₹24 L** additional brokerage, before referrals.

Business impact. Listings become a controlled input instead of luck; exclusive share rises because we arrive first with buyers in hand; the brand becomes "the agency that calls you with a buyer".

Agent time. +2 h/week of calls, but the research and scripting (today ~4 h/week when done at all) disappears.

Risks. DPDP: only contact people with a lawful basis (existing relationship, consent, public business listing); keep a do-not-contact flag everywhere. Accuracy: start with top-decile scores only; measure list rate per 100 contacts.

Success. Listings per month; share of listings that are exclusive; outreach-to-listing rate ≥ 5 % by month 6.

B. Onboarding & listing — the seller autopilot

Current status. Listing type, documents checklist (non-blocking), brochure v1/v2 and mapping exist. Details are typed by staff; the owner's approval gate is not enforced; there is no agreement workflow, no price opinion, no instant listing presentation.

What we introduce.

#	Initiative	Effort	What it is
B1	**WhatsApp intake**	M	TailorTalk asks the 30-field checklist conversationally, in Tamil or English, with photos and documents as attachments; fields land on the card; staff only review
B2	**Document AI and "3 PIN Verified"**	M	EC, patta/chitta, sale deed, approved plan and tax receipts are read by AI (Landeed-style, or Landeed's API); ownership chain, encumbrances and mismatches are flagged; a verified badge appears on the listing, brochure and site. Documents still never block marketing
B3	**Chennai price desk**	M	A price opinion per property from guideline value (floor), our own comparables (closed deals, visit feedback, price edits), portal asks by micro-locality, and the demand map. Shown as a range with reasons; refreshed monthly; exported as a one-page "Price note"
B4	**Instant listing presentation**	S	A personalised PDF and 60-second video in the owner's language: price note, buyers already matched (count and profiles), the marketing plan (shoot date, outlets, brochure), the verified badge, the agreement terms
B5	**Agreement and approval gate**	S	Exclusive/Collab agreements e-signed (Leegality/Digio); the owner's one-tap approval before any agreement is drafted; a shoot for Exclusive/Collab can only be booked after sign + check (Normal skips it, as the owner's process says)
B6	**Missing-paper nudges**	S	Weekly WhatsApp nudges to the seller for Missing/Applied documents, with how-to links (e.g. EC online); surfaced in Daily task

Why. Sellers choose the agency that shows them a price, buyers and a plan in the first conversation. Verification is the single biggest trust gap in Indian resale and nobody local badges it. Exclusive listings double revenue per property and remove co-broking leakage.

Day after. A seller who messages at 9 pm has answered the checklist by 9:20, received a price note and presentation by 9:25, and seen that six buyers match. In the morning the owner sees one approval request. Staff typing drops to review.

How to build. B1 extends TailorTalk's prompt and the card's field model; B2 wraps a document-reading model behind the finance-upload style Drive guard; B3 is a module over the fact store, the area model and the change log; B4 is the brochure pipeline with a new template plus Sarvam TTS; B5 is e-sign API + the listing-type field; B6 reuses the follow-up digest.

Financial impact. Exclusive share from (assume) 20 % to 50 % of listings; each conversion adds a second side (~₹1 L per ₹1 Cr deal). Verification can be a paid service to owners (₹2,000–5,000) or a differentiator. Price desk reduces overpriced, unsellable listings (fewer wasted shoots at ₹3–5k each).

Business impact. Faster time-to-market (owner yes → live in 7 days instead of 2–3 weeks); fewer disputes at registration; a brand promise ("every 3 PIN listing is verified and fairly priced").

Agent time. −3 h/week typing and chasing per agent; the owner's approval takes 2 minutes a day.

Risks. Document AI must say *"needs a lawyer"* rather than guess; legal opinions stay with a panel advocate. Price notes are opinions, never valuations for lending.

Success. Owner-yes → live median days; exclusive share; documents complete at listing (%); seller NPS after onboarding.

C. Showcasing — media that sells, from one visit

Current status. Photos, video, drone, floor plan and virtual tour are tracked as a brief; one shooter per visit; editors cut per outlet with V/O; brochure PDF. No 3D tour, no staging, no Tamil narration at scale, no property microsite. Buyers increasingly expect to walk through before visiting.

What we introduce.

#	Initiative	Effort	What it is
C1	**One-visit media kit**	M	Standard capture: phone photos + 360 camera (Insta360 X6 class, ~₹50k) + LiDAR phone scan. From one visit: HDR photos, 2D floor plan with measurements, a **Gaussian-splat walkthrough** (photoreal, phone-viewable), a 30-s vertical reel, a 60-s YouTube cut, 10 stills for carousels. The brief on the card becomes a kit checklist
C2	**Virtual staging and clean-up**	S	Vacant or cluttered rooms staged in minutes (apps stage 10,000+ homes a month at ~₹200/image); day-to-dusk exteriors; labelled "virtually staged"
C3	**Tamil-first narration and avatar**	S	A consented clone of the owner's voice (Sarvam Bulbul, 11 Indian languages, Tanglish-aware) narrates every reel in Tamil and English from the AI-written script; an avatar presenter for listings nobody can front; captions auto-generated
C4	**AI copy per buyer persona**	S	Listing text, reel scripts, carousel captions and brochure copy written from the facts (never invented), in the voice of the locality and the likely buyer (family, investor, NRI); A/B tested by leads per post
C5	**Property microsite ("Showcase")**	M	One page per listing: splat tour, floor plan, photos, map and commute, verified badge, price note, WhatsApp button; shareable link used in every outreach; indexable for GEO
C6	**Editor copilot**	S	Rough-cut assembly from the shot list (music, order, titles), so the editor finishes rather than starts; capacity forecast from the edit timings already recorded

Why. Reels are the highest-engagement format on Instagram (3.7 % average; 2.7× carousels); 52 % of agents say social leads beat portal leads. Immersive listings are now native on the big portals; a buyer who has walked a splat tour arrives at the site visit pre-sold. Media is also the cheapest way to earn exclusives ("you cannot get this anywhere else").

Day after. A shoot produces ten assets instead of two; the editor's queue shows rough cuts waiting for a decision rather than raw footage; every listing has a link to send; the Tamil reel goes out the same day as the English one.

How to build. C1 adds kit items to `MEDIA_KEYS` and a splat processing step (hosted service or local GPU); C2/C3/C4 are API calls from the board (staging, Sarvam, LLM) with human approval; C5 is a static page generator fed from the inventory and the posting tracker; C6 sits in the Editor view.

Financial impact. Media cost per listing roughly flat (₹3–5k) for 5× the assets; listings with immersive media sell faster and at closer to ask (industry claims vary; we measure). Staging ₹200/image against a visit saved.

Business impact. Instagram reach per listing ×3–5; exclusive wins; fewer wasted visits (buyer disqualifies online).

Agent time. Shooter: +20 min per visit for the 360 pass. Editor: −30–40 % per cut. Owner: fewer "what should we post" decisions; the plan writes itself (Section E).

Risks. Staged images must be labelled (RERA/consumer protection); voice cloning needs written consent and a stored sample; splat hosting costs scale with listings (budget ₹200–500 per tour).

Success. Assets per shoot; leads per listing in the first 7 days; visit-to-offer rate for listings with a tour vs without.

D. Distribution — be where every buyer looks

Current status. Posts go to Instagram/Facebook/YouTube by hand and are confirmed with URLs; 99acres and the website are updated by hand; no feeds; no own search site; nothing targets AI search.

What we introduce.

#	Initiative	Effort	What it is
D1	**Portal syndication**	M	One listing record pushed to 99acres, MagicBricks, Housing.com and the website with the right photos and copy per portal; status and price changes sync; leads from portals flow into the CRM with source attribution
D2	**Own search site with GEO**	M	A fast listing site: conversational search ("3BHK near Guindy metro under 1.2 Cr, east facing"), locality guides in Tamil and English (prices, schools, commute, floods, upcoming infra), FAQs, agent pages, verified facts — written to be *cited* by ChatGPT, Gemini and AI Overviews (real estate's AI visibility is 0.14 %; the field is empty)
D3	**WhatsApp distribution**	S	WhatsApp Channel for new listings; broadcast lists by locality/budget (opt-in); WhatsApp Flows for "book a visit", "get the price note", "share a referral"; catalog messages with the microsite link
D4	**Matched-buyer push**	S	A new or re-priced listing triggers a message to every matched buyer (through the match engine's existing ranking) with the microsite and a one-tap visit slot; agents approve the batch
D5	**Ask 3 PIN**	M	The inventory and locality knowledge exposed as a ChatGPT app / WhatsApp assistant: a buyer describes what they want and gets our stock, a price note and a visit booking, 24×7

Why. A listing seen by 10× more qualified people sells faster at a better price; distribution is also the owner's reason to sign exclusive. Buyers now start in AI answers (67 % in a 2026 US survey); Chennai content in Tamil that answers "is Perumbakkam flood-prone?" will be quoted for years.

Day after. Posting "Confirm posted" becomes "Published to 4 portals, 1 channel, 38 matched buyers"; the CRM shows leads by portal and by post; the site brings organic leads with zero ad cost.

How to build. D1 uses portal APIs/feeds (where available) with a mapping layer from the inventory fields; D2 is a static site built from the fact store (same build pattern as the documentation pack) with structured data; D3/D4 reuse TailorTalk templates and the match engine; D5 wraps the match engine and price desk in an assistant endpoint (the MCP server from K).

Financial impact. Portal and social leads at ₹0–300 each against ₹300–1,500 paid; +30–50 % lead volume without ad spend in year one (assumption); exclusive conversions as above.

Business impact. Faster sales, more exclusives, lower cost per lead; a web asset that compounds.

Agent time. −2 h/week of portal posting and copy-paste.

Risks. Portal rules on duplicates and photos; keep one source of truth (inventory) so prices never diverge; WhatsApp templates must stay utility-grade to avoid blocks.

Success. Leads by source; cost per lead; organic share of leads; days on market.

E. Attraction and influence — the content engine, Chennai edition

Current status. The owner fronts the content and pastes a weekly plan; posts are tracked and URLs saved; attribution (which post brought which lead) is not measured; the plan is made from memory.

What we introduce.

#	Initiative	Effort	What it is
E1	**Content plan from inventory**	S	Eåsy proposes next week's plan from what is new, what has a tour, what has buyers waiting, what is priced to move, and what performed last month; the owner edits and pastes (the existing Paste week plan accepts it)
E2	**Series and formats**	S	"Chennai Street Price" (one street a week, with the price desk), "Verified or not" (document stories), "Before visit / after visit", buyer education in Tamil; 2 reels/day across outlets; carousels for saves; Stories daily
E3	**Attribution**	S	Post live times joined to leads (codes in chats, link clicks with tags, "where did you see us" in the AI intake) → leads and visits per post, best slots, best formats
E4	**Creator and community collabs**	S	Tamil lifestyle/finance creators and society groups; co-branded tours; the collab outlet on the board finally has a channel
E5	**Newsletter and WhatsApp monthly**	S	A monthly Chennai market letter (price desk data, new stock, sold stories) to every contact who opted in; the same content feeds GEO

Why. The Serhant playbook is a *volume* content machine attached to a brokerage; 38 % of agents' new clients come from social; a measured engine beats an inspired one. Our media pipeline already produces the assets.

Day after. Monday's plan arrives drafted; every post has a number next to it a week later; the editor knows which formats are worth the hours.

Financial impact. Content leads at near-zero marginal cost; ad spend redirected to retargeting warm audiences.

Business impact. Brand = "the Chennai agency that knows prices and tells the truth"; inbound sellers rise with reach.

Agent time. Owner −2 h/week planning; editor focus on winning formats.

Risks. Burnout and sameness — the plan must rotate formats; claims in content must come from the fact store.

Success. Leads per post; followers who become leads; sellers who cite content as source.

F. Lead matching and conversion — never lose a lead to time

Current status. TailorTalk answers chat within seconds; phone calls are not captured; follow-ups are rule-based reminders; the AI places leads forward-only; matching is strong; there is no deal score, no next-best-action, no coaching from real conversations.

What we introduce.

#	Initiative	Effort	What it is
F1	**AI voice agent on the main number**	M	Answers in Tamil/English 24×7, qualifies (budget, locality, BHK, timeline, self-use/investment), offers matching stock, books a visit into the agent's calendar, sends the WhatsApp pack; hands hot leads to a human within 60 s in office hours. Inbound and opted-in callbacks only (TRAI)
F2	**Every call becomes a note**	M	Agent calls through a cloud number (Exotel/Ozonetel class), recorded with consent; Tamil + English transcription; the lead AI writes the note, follow-up, interest, stage and visit — the agent confirms
F3	**Deal score and next best action**	M	Per lead: probability and value (milestone speed, match confidence, objections, response times, budget vs stock) and the one action that moves it; the Follow-ups queue is ordered by expected value, not by date alone
F4	**Going-cold and revival**	S	Drafted nudges when a lead cools; parked buyers revived automatically when matching stock arrives or a price drops (links to D4)
F5	**Pre-visit brief and objection library**	S	One page before every visit: who, what they said, their vetoes, the seller's floor, comparable sales, likely objections and tested replies, learned from transcripts and visit feedback
F6	**Coaching flywheel**	M	Weekly, per agent: response times, what worked in Tamil conversations, role-play on real objections

Why. Response time is the single largest conversion lever (8–9× within 5 minutes; 3× qualification with voice agents in India). The phone is still where Chennai buyers and sellers close. A lead worked by score, not by memory, is how the best teams reach 8–10 % against 1–3 %.

Day after. No missed call after hours; every call has a note in two minutes; the follow-up queue starts with the ₹ at stake; agents walk into visits briefed.

How to build. F1/F2 are a telephony integration feeding the existing lead AI (`api/_lead-automation.js`) and calendar sync; F3 is a scoring module on the fact store with the existing attention rules; F4 extends the automation and the match engine; F5 assembles the lead case file; F6 is a weekly job over transcripts and `reached` dates.

Financial impact (model). Lead-to-deal from (assume) 2 % to 5 % on today's ~70 leads a month = +2 deals a month ≈ **₹2–4 L/month** brokerage; after-hours leads from near-zero to a measurable share.

Business impact. Fewer agents needed per deal; consistent client experience; a defensible "we answer in 60 seconds" promise.

Agent time. −5 h/week on note-taking and chasing cold leads; +2 h on visits with hot ones.

Risks. Recording consent and DPDP (duties bind from May 2027); the voice agent must hand over gracefully; scoring must stay explainable and never hide a lead.

Success. Median first-response time (all channels); lead-to-visit and visit-to-deal rates; revenue per lead.

G. Site visits and the buyer experience

Current status. Visits are booked by staff with calendar invitations to agents; the buyer gets what the agent sends; feedback is captured after; no buyer-facing portal; no virtual-first step.

What we introduce.

#	Initiative	Effort	What it is
G1	**One-command booking**	S	"Book Shiva at the Anna Nagar 3BHK, 2 pm tomorrow" (voice or text) → lead and property found, free agent picked by rule, one-tap confirm, WhatsApp confirmation to the buyer with map pin, parking, agent and what to bring; reminders; feedback asked by AI afterwards
G2	**Virtual-first visits**	S	Before a physical visit, the splat tour and price note go out; buyers rank 3 options; physical visits are booked only for the shortlist — the "Showcase" from C5
G3	**My 3 PIN buyer portal**	M	A WhatsApp-first (and web) space per buyer: shortlist, visits, documents requested, loan pre-approval status, offers made, next steps — the Compass One idea at our scale
G4	**Offer and negotiation assistant**	S	For the agent: comparable sales, the seller's recorded floor, the buyer's budget signals, suggested anchors and a draft offer message; for the buyer: a transparent cost sheet (price, registration, stamp duty, GST where applicable, loan EMI)
G5	**Loan pre-approval partner**	S	In-chat pre-approval through a DSA partnership (banks pay 0.9–1.35 % of the loan to the DSA); buyers arrive at visits financeable

Why. Visits are the expensive step (agent hours, fuel, the seller's patience); a buyer who has walked the tour and is pre-approved converts at a multiple. Zillow's AI mode shows the expectation: the system *takes the next step* for you.

Day after. Half of first "visits" happen on the phone; the agent's calendar shows fewer, better visits; the buyer always knows what happens next.

Financial impact. Visits per deal from (assume) 12 to 7 → agent capacity +40 %; DSA income ₹70–100k per ₹1 Cr loan (0.9–1.35 % on an 80 % loan) on deals we would have closed anyway.

Business impact. Buyer NPS; repeat and referral; a loan line that pays for the whole stack.

Agent time. −4 h/week of unproductive visits and coordination.

Risks. Cost sheets must be right (stamp duty and registration rules change); keep a disclaimer and a monthly check. DSA needs registration and compliance.

Success. Visits per deal; visit-to-offer rate; loan attach rate.

H. Transaction and closing — the AI transaction coordinator

Current status. Finance records the deal, token, invoices and GST; the steps between "Won" and registration (agreement, KYC, documents, bank, slot, registration, patta transfer, handover) live in people's heads and chats.

What we introduce.

#	Initiative	Effort	What it is
H1	**Transaction coordinator agent**	M	A per-deal checklist (token → agreement → KYC → loan sanction → registration slot → registration → patta/mutation → handover) with owners, dates, documents and nudges to buyer, seller, bank and advocate on WhatsApp; the CRM lead, the board card and the Finance deal linked
H2	**E-stamp, e-sign, KYC/PMLA**	S	Agreements e-signed; KYC collected in chat and stored under the finance guard; PMLA records once turnover passes the threshold
H3	**Registration intelligence**	S	Guideline value lookup, stamp duty and registration fee calculator, document list per property type, sub-registrar office and slot guidance
H4	**Post-registration follow-through**	S	Patta transfer, EB/water name change, society transfer, handover checklist, and the first "home anniversary" touch — the start of the after-sale relationship (I)

Why. Deals fall through between yes and registration; legal departments using AI cut closing time 31 % and document review cost 44 %. A coordinated closing is also where a brokerage earns trust and referrals.

Day after. Every open deal shows its stage and the next action with a date; the owner sees "6 deals, 2 waiting on bank"; nobody forgets the patta.

Financial impact. Fewer lost deals after token (assume 10 % → 4 %) = brokerage saved; faster cash collection (invoices tied to steps).

Business impact. Repeatable closings; a service clients talk about.

Agent time. −3 h/week per active deal.

Risks. Legal advice stays with advocates; the agent coordinates, it does not opine.

Success. Token-to-registration days; fall-through rate; receivable days.

I. After-sale and "maintain" — the recurring revenue lines

Current status. None. A sold property disappears from matches; a rented one is not managed; no relationship with past clients.

What we introduce.

#	Initiative	Effort	What it is
I1	**Rental and property management**	L	Tenant finding (our matching engine already serves tenants), verification, agreement, UPI AutoPay/e-NACH rent collection, maintenance tickets routed to vendors, quarterly inspection with photos, owner statements; priced at 8–10 % of rent (NoBroker's benchmark), with an NRI tier
I2	**Services marketplace**	M	Home loans (DSA), interiors (partner programmes pay ₹25–50k per referral at the large brands), movers, legal, cleaning, insurance — offered at the right moment by the transaction agent, tracked in Finance
I3	**Annual home value report**	S	Every past client receives a yearly price note for their home from the price desk, in Tamil/English, with "want to know what it rents for?" — the cheapest source of repeat listings
I4	**Client club and referrals**	S	Birthdays, anniversaries, registration anniversaries (Compass-style occasions) and a referral reward; all through WhatsApp, all measured
I5	**Investor products**	S	For investor buyers: rental yield notes, SM REIT/fractional options through a registered partner (advise and refer, never custody), portfolio reviews

Why. Brokerage income is lumpy; management and services income is monthly. NoBroker reached ₹1,000 cr on exactly these lines. The relationship after the sale is where the next listing comes from.

Day after. A sold flat becomes a managed asset or a future listing; the owner's dashboard gains a "recurring" line next to brokerage.

Financial impact (model). 100 managed units × ₹25,000 rent × 9 % ≈ **₹2.7 L/month** recurring by year two; services referral ₹20–50k per deal attached (assume 40 % attach); value reports convert 3–5 % of past clients a year into listings.

Business impact. Valuation of the company shifts from commission book to recurring revenue; churn-proof relationships.

Agent time. Management needs an operations person, not agents; agents gain listings from I3/I4 at no time cost.

Risks. Management has service risk (maintenance, deposits) — start with 20 units and SLAs; referrals must be disclosed; investor advice stays with regulated partners.

Success. Managed units; recurring revenue share; repeat/referral share of listings.

J. The agent back office — Eåsy, the chief of staff (detailed in section 12)

Current status. Daily task, digests at 08:00/09:00/21:30, mentions and the AI queue exist; the agent still updates the CRM by hand, drafts every message, builds every presentation, and reports by memory.

What we introduce.

#	Initiative	Effort	What it is
J1	**Eåsy, proactive**	L	Each morning Eåsy has already: drafted follow-ups due, prepared visit briefs, flagged likely sellers, queued the content plan, reconciled yesterday's calls to notes, listed approvals. The agent clears, edits, sends. Eåsy works from the fact store and the approval queue — the S.MPLE 2.0 pattern
J2	**Voice and text commands**	M	"Move Shiva to negotiation, follow up Friday 4 pm, send him the Velachery tour" from WhatsApp or the CRM, in Tamil or English; confirmation before anything irreversible
J3	**Generators**	S	Listing presentation, CMA/price note, visit pack, offer letter, weekly owner report, Instagram captions — one tap, from facts
J4	**Weekly report that writes itself**	S	Monday: visits, conversion, feedback themes, media pipeline, money, what to change — to the owner and each agent
J5	**Approval queue and audit**	S	One queue for anything consequential; every AI action logged, undoable for 7 days (exists for stages; extended to messages, listings, prices); AI self-audit of accuracy

Why. This is the measured core of the SERHANT and Compass results (hours returned, GCI up). A small team with a chief of staff behaves like a team twice the size.

Day after. The agent's day starts with decisions, not data entry.

Financial impact. At 10 hours/week returned per agent (Compass reports 15–20), a 6-person team gains ~250 productive hours a month — worth 2–3 extra deals a month if spent on sellers and visits (model).

Business impact. Scale without proportional hiring; new agents productive in days (Eåsy carries the process).

Agent time. −8 to −12 h/week.

Risks. Over-automation erodes judgement — keep approvals; measure AI accuracy weekly; one daily AI budget per feature.

Success. Hours returned (measured from task logs); approvals per day; AI accuracy; revenue per agent.

K. Data and intelligence — the moat

Current status. The platform already stores milestone dates, who moved what, AI verdicts and human undos, chat signals, visit declines, price edits, edit timings and post live times — read by almost nothing.

What we introduce.

#	Initiative	Effort	What it is
K1	**Nightly fact store**	M	Compressed, topic-wise facts (same pattern as the finance snapshot), the base for every agent, report and score; reads stay inside the free quota
K2	**Chennai price desk and demand map**	M	B3 plus the locality graph: price ranges by street/society, days on market, price-cut signals, buyer demand by locality/budget/config; monthly report (also a public content product)
K3	**Attribution**	S	Lead → source → post/ad → visit → deal → ₹; return per ad, per post, per portal
K4	**AI self-audit and ops sentinel**	S	Accuracy of AI placements and scores (from undos and outcomes), dead letters, failed syncs, cost per feature
K5	**3 PIN MCP server**	M	The fact store, match engine and analytics exposed to Claude/ChatGPT with the owner's login: "which localities are we losing buyers in?" answered from live data

Why. Every initiative above needs facts; the data is the one thing competitors cannot buy.

Financial impact. Enables everything else; avoids read-quota costs (the lead views already cut CRM opens from ~760 reads to 39).

Success. Fact-store freshness; questions answered without an engineer; attribution coverage of leads.

L. New business models — the 10× bets

#	Bet	What it is	Why it could be big	Guardrail
L1	**Verified-exclusive brokerage**	Every listing verified, priced, toured and distributed everywhere; exclusives as the default offer	Doubles revenue per property; the brand buyers trust	Keep Normal listings for owners who refuse
L2	**Rental and management ARR**	I1 at scale, NRI focus	Monthly income; a client base that re-lists through us	Operations SLA before scale
L3	**Embedded finance**	Loans (DSA), insurance, interiors referrals	₹70–100k per ₹1 Cr loan; services ₹20–50k per deal	Disclose; registered partners only
L4	**Autopilot for other brokers (SaaS)**	License Eåsy, the price desk, the media pipeline and verification to Chennai brokers; or run the co-broking exchange	MagicBricks sells CRM to 85k brokers; a Tamil-first, verification-led product has no local owner	Only after it runs 3 PIN for a year; multi-tenancy is already in the code
L5	**Data products**	Monthly Chennai micro-market report, price notes for banks/NRIs, demand reports for developers	Developers and lenders pay for demand data; GEO citations compound	Aggregate only; no personal data
L6	**Investor distribution**	SM REIT/fractional referrals for investor buyers (₹10 L tickets, 8–10 % yields)	New product for the same client	Refer to SEBI-regulated platforms; never hold money

6. Why this succeeds here, and what would make it fail

Why it works. (1) The data and the pipeline exist; most of the plan is wiring and models, not new systems. (2) Tamil-first AI is now production-grade (Sarvam, Bhashini), and no Chennai agency uses it. (3) The owner already fronts content and already runs the post plan — the engine formalises what works. (4) Multi-tenant, serverless and cheap to run: the stack scales without a team of engineers. (5) Each wave pays for the next (section 8).

What would make it fail. Building channels before facts (nothing to say); automating first contact before consent and quality (blocks, complaints); letting AI decide prices or Won; media formats without measurement; management without operations; and too many parallel bets — hence the waves.

7. Sequencing — six waves, 24 months

Wave	When	Ships	Unlocks	Exit criteria
0 · Facts	Nov–Dec 2026	K1 fact store, K3 attribution, K4 sentinel, do-not-contact flag, roles, recorded-call consent texts; B6 nudges	Every later agent	Fact store fresh daily; 90 % of leads attributed
1 · Answer and act	Jan–Mar 2027	F1 voice agent, F2 calls → notes, G1 one-command booking, J2 commands, J4 weekly report, F4 revival, D4 matched push	Speed-to-lead; agent hours	Median first response < 60 s all channels; +2 h/week/agent returned, measured
2 · Seller autopilot	Apr–Jun 2027	B1 intake, B3 price desk, B4 presentation, B5 approval + e-sign, A5 gap engine, C3 Tamil narration, C2 staging	Exclusives; trust	Exclusive share ≥ 40 %; owner-yes → live ≤ 7 days
3 · Showcase and distribute	Jul–Sep 2027	C1 media kit + splat tours, C5 microsites, D1 syndication, D2 GEO site, D3 WhatsApp channels, E1–E3 content engine with attribution	Reach; organic leads	Organic/portal share of leads ≥ 40 %; leads per listing ×3
4 · Source and close	Oct 2027–Jan 2028	A1 likely-to-list, A2 outreach, A3 co-broking feed, A4 referrals, H1 transaction coordinator, H2 KYC/e-stamp, G5 loans, B2 verified badge	Listings; closings; loan income	Listings/month ×1.5; fall-through ≤ 5 %; loan attach ≥ 30 %
5 · Recur and scale	Feb–Oct 2028	I1 management (20 → 100 units), I2 marketplace, I3 value reports, I4 club, J1 Eåsy proactive, K5 MCP, D5 Ask 3 PIN, G3 portal, L4/L5 pilots	Recurring revenue; the 10×	Recurring ≥ 25 % of revenue; revenue per agent ×3 vs 2026

Each wave is 3–4 initiatives in flight, one release gate as today (review → fix → re-review → tests → rules → push), and a kill switch per feature.

8. The financial model — assumptions to replace with Finance's numbers

The model is a spreadsheet of nine inputs; everything else is arithmetic. Inputs marked *A* are assumptions for a Chennai mid-segment agency and should be set from the Finance console and the CRM's analytics.

Input	Today (A)	Wave 2	Wave 5	Source of truth
Leads per month	70	100	180	CRM analytics (leads created)
Lead → deal	2 %	4 %	6 %	`reached.won` ÷ leads
Average ticket	₹1.0 Cr	₹1.1 Cr	₹1.2 Cr	Finance deals
Brokerage per side	1 %	1 %	1 %	Finance invoices
Sides per deal (exclusive share)	1.2	1.5	1.7	Listing type
Listings per month	8	12	20	Board cards created
Loan attach × DSA payout	0	20 % × ₹80k	35 % × ₹80k	Finance, partner statements
Services referral per deal	0	₹10k	₹25k	Finance
Managed units × rent × fee	0	20 × ₹25k × 9 %	100 × ₹25k × 9 %	Finance recurring

Brokerage per month = leads × conversion × ticket × 1 % × sides. Today ≈ 70 × 2 % × ₹1 Cr × 1 % × 1.2 = **₹1.7 L**. Wave 2 ≈ 100 × 4 % × 1.1 Cr × 1 % × 1.5 = **₹6.6 L**. Wave 5 ≈ 180 × 6 % × 1.2 Cr × 1 % × 1.7 = **₹22 L**. **Add-ons at Wave 5:** loans 10.8 deals × 35 % × ₹80k ≈ ₹3 L; services ≈ ₹2.7 L; management ≈ ₹2.3 L. **Total ≈ ₹30 L/month, about 17× today's brokerage-only figure on these assumptions** — which is why the plan calls 10× conservative *if* conversion and exclusives move as the benchmarks say. If conversion only reaches 4 % and sides 1.5, Wave 5 is still ≈ ₹13 L + add-ons ≈ ₹20 L, about 12×.

Costs (run-rate, A). AI and telephony APIs ₹25–60k/month at Wave 5 (voice minutes, Tamil TTS, transcription, LLM calls under per-feature budgets); media tools and splat hosting ₹15–30k/month; e-sign/KYC per use; one operations person for management from Wave 5; engineering as today (the platform is built in-house with Claude Code). **Payback:** Wave 1 pays for itself with one extra deal a month.

Agent time (A). Per agent per week: back office −8 to −12 h; chasing and notes −5 h; unproductive visits −4 h; sourcing calls +2 h; net **−15 to −19 h**, i.e. a 6-agent team gains the capacity of 3 more agents without hiring.

9. The scorecard the owner watches

North-star	Why	Target by Oct 2028
Revenue per agent per month	The 10× in one number	×3 vs 2026
Median first response, all channels	The conversion lever	< 60 s
Lead → deal	Quality of the whole funnel	≥ 6 %
Exclusive share of listings	Revenue per property, trust	≥ 50 %
Listings per month and source mix	Growth ceiling	×2.5; ≥ 30 % from sourcing/referrals
Organic share of leads	Cost structure	≥ 40 %
Owner-yes → live days; token → registration days	Operational speed	≤ 7; ≤ 45
Recurring revenue share	Company value	≥ 25 %
Hours returned per agent per week (measured)	Capacity	≥ 12
AI accuracy and undo rate	Safety	≥ 90 %; < 5 % undone

10. Guardrails and regulation

- **People decide:** Won, listings going public, prices, agreements and first contact are approved by a person; every AI action is logged and undoable.
- **DPDP Act:** consent texts for recorded calls and marketing; purpose limits; deletion schedules; processor agreements with every AI vendor; duties bind from May 2027 — Wave 0 includes the texts and the flags.
- **TRAI:** no unsolicited AI calls; promotional calls from registered series only; outbound AI calls only to opted-in numbers.
- **WhatsApp:** free-form only inside the 24-hour window; approved templates otherwise; utility messages stay utility.
- **RERA and advertising:** AI-staged images labelled; facts in listings from the verified record; no invented features.
- **PMLA/KYC** once turnover passes the threshold; **SEBI**: investor products through registered platforms only; **loans** through a registered DSA.
- **AI budgets:** one daily budget per feature; a kill switch per feature; accuracy reviewed weekly.

11. What to decide now

1. Approve Wave 0 and Wave 1 (facts, answer-and-act) to start in November.
2. Choose the telephony partner and the Tamil voice vendor (consent for the owner's cloned voice).
3. Decide the exclusive offer (terms, fee) so Wave 2 has something to sell.
4. Name the operations owner for rentals and management before Wave 5.

5. Set the nine model inputs from Finance so targets are real numbers, not assumptions.
6. Name Eåsy as the product: approve the wordmark, and that every reminder and assistant in the platform speaks as Eåsy from Wave 1.
7. Pick the first three sole-selling mandate targets and the legal entity for the development chain (section 14).

12. Eåsy by 3 PIN — a personal AI staff for every user

BY 3 PIN

Wordmark: **Sora Bold**, lowercase, tight tracking; the ring of the **å** in brand orange `#FF8A00` — the "always on" light. Ink `#111` on white, white on ink for dark. Never stretched; never with a drop shadow. Spoken as "easy". App icon: the orange ring alone on an ink tile.

What it is. Eåsy is the one place every person at 3 PIN — agent, shooter, editor, accounts, the owner — asks for anything and gets it done: on WhatsApp, in the CRM, by voice in the car. It is the chief-of-staff layer from section 4, given a face. It knows the user's role, their leads, cards, visits, shoots, deals and the whole fact store (section K), and it can *act* through every tool the platform already has: drafts, bookings, brochures, catalogues, calendar, Posting, Finance. Anything consequential goes to the approval queue; everything else just happens.

What you can ask — the first fifty. All answered from live data, in Tamil or English, text or voice.

Ask Eåsy...	What it does	Needs
"What is my day?"	Visits, follow-ups due, shoots, edits, approvals waiting, mentions — ordered by value, with one-tap actions	Daily task + fact store (exists)
"Is any shoot scheduled this week?" / "Who shoots the Anna Nagar flat?"	Reads the board; offers to call the shooter or move the slot	Board (exists)
"Do I have to follow up anyone today?" / "Who went cold?"	The follow-up queue by deal score; drafts each message	F3, F4
"Remind me to call Shiva at 4" / "Remind me every Monday to check the Velachery seller"	Reminders become follow-ups and calendar entries; recurring ones are rules	CRM + calendar (exists)
"Send the Velachery 3BHK brochure to Shiva"	Finds the lead and the property, picks the latest brochure, sends on WhatsApp with the microsite link, logs it on the lead	Brochure pipeline + TailorTalk (exists)
"Make a catalogue of matching properties for Priya and send it"	Runs the match engine for her, builds a PDF/WhatsApp carousel (photos, price, tour link, why it matches), you approve, it sends and records what was shared	Match engine (exists) + C4/C5
"Which property can I close with my current leads?"	Ranks your stock by number and heat of matched buyers, visit feedback and area trend; says which three to push and to whom	F3 + K2
"What is the rate in Anna Nagar H Block?" / **"Recent transactions in Anna Nagar H Block"**	Price desk: guideline value, our comparables, portal asks, registration-data comparables where licensed, with dates and ₹/sq ft; a one-page note on request	B3/K2 + registration data partner
"Which areas are hot this month?" / "Where are we losing buyers?"	Demand map: enquiries, visits, vetoes and unmet demand by locality, budget and configuration	A5/K2
"Show me analytics for last month" / "How did Instagram do?"	Leads, visits, conversion, leads per post, cost per lead, revenue — as a card, with the chart	K3
"Ask the seller if he can show the flat Saturday 11"	Messages the seller on WhatsApp in their language, reads the reply, books the slot, tells the buyer and the agent	TailorTalk + calendar (exists) + G1
"Book a site visit for Shiva at the Adyar villa, 2 pm tomorrow"	One-command booking (G1): free agent by rule, invitations, buyer pack	G1
"Generate the commission agreement for this seller"	Fills the Exclusive/Collab/Normal template from the card (owner, property, price, fee, term), sends for e-sign after your approval, files it with the deal	B5
"Draft the offer for Shiva at 1.45 Cr" / "What should we counter?"	Offer and negotiation assistant (G4) with comparables and the seller's floor	G4
"Create the price note for the Perumbakkam seller" / "Make the listing presentation"	Generators (J3): PDF and a 60-second video in the owner's language	B3/B4
"What is missing on the Kilpauk card?" / "Chase the seller for the EC"	Reads the documents checklist; sends the nudge with the how-to link	B6
"Post the Anna Nagar reel to Instagram and YouTube on Friday 6 pm"	Schedules in Posting; confirms when live and saves the URL	Posting (exists) + D1
"Plan next week's content"	Content plan from inventory and last month's results (E1)	E1

Ask Eåsy…	What it does	Needs
"Move Shiva to negotiation, follow up Friday" / "Mark the Velachery flat sold"	CRM and board updates by voice, confirmation before anything irreversible	J2
"What happened on my calls today?"	Calls → notes (F2): the summary and the follow-ups it set	F2
"Raise the buyer-side invoice for the Adyar deal" / "What is owed to us?"	Finance: invoices, receivables, GST, cash forecast	Finance (exists) + K
"How much did we make from Instagram leads this quarter?"	Attribution to ₹	K3
"Which of my past clients might sell?"	Likely-to-list scores (A1) with the reason and the script	A1/A2
"Find me three 2BHKs in Velachery under 90 L"	Sourcing inbox (A3) and co-broking stock, de-duplicated against ours	A3
"Explain stamp duty for a 1.2 Cr flat in Chennai" / "What documents for a plot sale?"	Registration intelligence (H3) with a cost sheet	H3
"Where is the Adyar deal stuck?"	Transaction coordinator (H1): stage, who, since when, next nudge	H1
"Prepare me for the 5 pm visit"	Pre-visit brief (F5)	F5
"Write a Tamil caption for this" / "Translate this to Tamil"	Copy and language layer (C3/C4)	C3/C4
"What is the rent for a 2BHK in Medavakkam?" / "Which of our owners would rent out?"	Rental desk for the management line (I1)	I1
"What should I do next?"	The one next best action across everything, with why	F3

How it answers. Every question becomes a plan: understand (role, who "Shiva" is, which property "the Adyar villa" is — from the fact store, never guessed), fetch (facts, price desk, match engine), act (tools with the same permissions the user has), confirm (anything that sends, books, prices or signs is shown first). The same engine serves WhatsApp (TailorTalk's assistant action), the CRM's command bar, voice (speech in Tamil/English via Sarvam), and the owner's MCP connection to Claude/ChatGPT. Every answer carries its sources (the card, the deal, the comparable) so it can be checked in one tap.

Reminders and the proactive side. Eåsy is not only asked; it tells. It owns the morning brief, the "going cold" nudges, document chasers, shoot-day packs, visit reminders to buyers, the Monday report and the evening summary — one voice for every reminder the platform already sends today, plus the new ones. Each person can tune what Eåsy raises and when (Settings → Configurations), and every reminder shows why it fired.

Per role. The agent sees leads, visits and stock; the shooter sees the day and the access notes; the editor sees cuts and deadlines; accounts sees money; the owner sees everything plus approvals and analytics. Role claims in the database rules (Wave 0) make this real rather than cosmetic.

Why it is the centre of the plan. The twelve areas above are features; Eåsy is how people use them. S.MPLE's measured result (28,000 hours returned; +144 % commission income) came from exactly this: one assistant that knows the business and acts. For a small team it is the difference between "we have tools" and "work gets done".

Money and time. No new revenue line of its own; it is the multiplier on every other one. Expect 8–12 hours a week per person returned (J1), faster onboarding of new agents (the process lives in Eåsy), and the owner's decisions made from live numbers instead of memory. Run cost is API usage under per-feature budgets (section 8).

How to build, in three steps. (1) *Ask*: the command bar and WhatsApp assistant over the fact store and the existing tools — read-only answers and drafts (Wave 1). (2) *Act*: bookings, sends, catalogues, agreements, posting, finance — with the approval queue and 7-day undo (Wave 2–3). (3) *Anticipate*: the proactive morning plan, likely-to-list, next best action, recurring rules (Wave 4–5). Voice and Tamil from step 1.

Guardrails. Eåsy never invents a fact (an answer without a source says so), never contacts a person outside consent, never marks Won, prices or signs without a human, logs every action, and respects do-not-contact everywhere.

13. Ruling the sector — the advanced bets

Ideas that use the data no one else in Chennai has, each with a clear first step.

#	Bet	What it is	Why it wins	First step (≤ 3 months)
R1	**3 PIN Chennai Index**	A monthly, public price and demand index by micro-locality (street, society, configuration) from the price desk: asks, closings, visit feedback, vetoes, days on market	The quoted source for Chennai prices in press, AI answers and bank conversations; sellers come to the agency that publishes the number	Publish for 10 localities from existing data; one page each in Tamil and English
R2	**Property Passport**	A living digital record per property: verified documents, measurements, floor plan, tour, every valuation, maintenance and rental history — transferable to the next owner	Turns a one-time sale into a lifetime record 3 PIN keeps; the natural home for management, value reports and the next listing	Start the passport for every verified listing (B2) and every managed unit
R3	**Transparent bidding for exclusives**	For priced-to-sell exclusives: a time-boxed, verified-buyer offer window with a live count, run by Eåsy, seller sees every offer	Best price for the seller in days, fewer rounds for agents, a reason to list exclusive	Pilot on 3 exclusives with the matched-buyer base
R4	**Sell-in-30 programme**	Exclusive + verified + full media + bidding + matched outreach, with a published 30-day target and a fee reduction if missed	A promise competitors cannot make without the pipeline	Define terms; run with 5 sellers; publish results
R5	**Instant-offer bridge (investor-backed)**	For owners who must sell now: an investor pool buys at the price-desk floor within 7 days; 3 PIN resells with its media and buyer base	iBuying-lite without balance-sheet risk; stock at a known discount	Term sheet with 2–3 investors; 1 property
R6	**3 PIN Partner network**	Independent Chennai brokers run on Eåsy, the price desk, verification and the media pipeline under a revenue share; shared, verified inventory	The sector's operating system; 10× listings without 10× staff; co-broking leakage becomes income	Onboard 5 partner brokers on the multi-tenant platform (already built)
R7	**Eåsy for buyers and owners**	A consumer edition: search by talking, verified listings with tours and price notes, visit booking, offers, loan pre-approval, the passport for owners	Owns the relationship portals rent to us	Ship as WhatsApp first (D5), then web
R8	**Data products**	Demand and price reports for developers, lenders and NRIs; absorption by micro-market; what to build where (section 14)	Developers and banks pay for demand data (PropEquity and Liases Foras exist for metros, nobody at street level in Chennai)	One developer, one report, one price

#	Bet	What it is	Why it wins	First step (≤ 3 months)
R9	**NRI desk**	Verification, management, value reports, remote selling with e-sign and video registration support, in English and Tamil	NRIs are Chennai's highest-trust-deficit segment; recurring management revenue	Package I1 + B2 + H2 for NRIs; 10 clients
R10	**Rent-to-own and managed-rental supply**	Owners' vacant units managed and rented to pre-qualified tenants who may buy; the data tells which units and tenants fit	Fills vacant stock, feeds future sales, management ARR	10 units from the rental desk

14. The next chain of business — joint ventures, construction and redevelopment

The case in one line. A brokerage knows what sells; a developer builds what it hopes sells. With the demand map, the price desk, the buyer base and the media engine, 3 PIN knows — by locality, configuration and price band — what is short, at what price, with buyers already waiting. That is the most valuable input a development has, and it is the input 3 PIN can sell, partner on, or build on itself.

What the market looks like. In Chennai, joint ventures between landowners and builders typically give the landowner 40–55 % of built-up area in established areas (Valasaravakkam ~45 %+, Iyyappanthangal/Maduravoyal 40–45 %) and 35–42 % in emerging corridors; the builder funds construction, approvals and sales. Projects over 500 sq m or more than eight units must register with TNRERA before marketing; smaller ones are exempt. Developer sole-selling mandates pay 2–4 % of sales against 1–2 % for ordinary channel partners. Demand data: 3BHK demand up 15 % in a year, mid-segment (₹50 L–1 Cr) 45 % of sales, premium 20 %.

The ladder — five steps, lowest risk first. Each step uses the previous one's data and relationships; none requires construction risk until step 4, and step 4 is deliberately small.

Step	Business	What 3 PIN brings	What 3 PIN earns	Risk	When
1	**Sole-selling and launch mandates** for small and mid developers	Demand evidence for their project, a pre-qualified buyer base, the media engine, Eåsy for their sales team, verified-process branding	2–4 % of sales value; marketing retainers	Low (effort only)	Now — use the demand map to pick 3 projects that match unmet demand
2	**Development advisory and data**	"What to build here" reports: configuration mix, pricing, absorption, buyer profile, by plot; feasibility against the price desk	₹2–5 L per report; retained advisory; mandate on the project	Low	Q1 2027
3	**JV facilitation and land aggregation**	Landowners from the likely-to-list engine and past clients; builders from step 1; the price desk sets a fair ratio; 3 PIN structures and documents the JV and takes the selling mandate	1–2 % of land value as facilitation + the mandate + management of the built units	Low–medium (legal)	Q2 2027
4	**Co-development of boutique projects** (≤ 8 units, under the RERA threshold, in demand pockets the data names) with a construction partner	Site selection from the demand map, pre-sales from the buyer base (bookings before ground-break), marketing, exit; the partner builds	Developer margin share (15–25 % of project value is the typical developer margin band; 3 PIN's share by equity and role) + mandate	Medium (capital, execution)	H2 2027 after step 3 has two JVs
5	**Redevelopment of 25–35-year-old apartments**	Society outreach (data: age, FSI headroom, demand), owner consensus tools, developer selection, 3 PIN as the marketing and resident-liaison partner	Facilitation, mandate on the surplus units, management of the rebuilt block	Medium (long cycle)	2028

Why the next twelve months, and why 3 PIN.

- *Demand is legible now.* By Wave 2 the demand map says, per micro-locality, how many buyers wait at which budget and configuration, what they vetoed and why. A developer with that list pre-sells; one without it guesses. Pre-sold projects finance themselves.
- *Pricing is defensible.* The price desk (guideline value, comparables, asks, closings) prices units to move; the index (R1) makes 3 PIN the public reference.
- *Buyers are already in the base.* Hundreds of qualified buyers with recorded requirements convert a launch into bookings in weeks; Eåsy's catalogues do the outreach.

- *Marketing is a machine, not a cost.* Media kits, tours, Tamil narration, portals and content run per project at marginal cost.
- *Landowners are our sellers.* The likely-to-list engine finds owners whose plots suit a JV before a builder's canvasser does; the verification badge and e-sign make 3 PIN the party both sides trust.
- *Capital is lighter than it looks.* Mandates and facilitation are fee income; co-development can start with one boutique project with pre-sales covering most of construction.

Illustrative numbers (assumptions to test on the first project). A boutique 8-unit project in an established pocket: 8 × 1,400 sq ft × ₹12,000 = ₹13.4 Cr sales. Mandate at 3 % = **₹40 L**. Facilitation on a ₹5 Cr land JV at 1.5 % = **₹7.5 L**. A 20 % co-development stake on a 20 % project margin = **₹54 L** over the project. One such project a year, plus three mandates on others' projects at ₹1–1.5 Cr of fees each at scale, exceeds the brokerage line in section 8 — and every unit sold enters the passport, management and resale cycle.

Branding. "Built on demand" — projects launched with the number of waiting buyers printed on the hoarding and verified by the index; the agency that tells developers what Chennai wants. This is the story that makes developers, landowners and investors call first.

Risks and guardrails. No construction before two JVs have closed through step 3; a construction partner with a track record, with 3 PIN's role defined in writing (marketing, sales, liaison, data); RERA registration where thresholds apply; separate legal entity and accounts for development; capital at risk capped per project; escrow for buyer money; no price or demand claim in marketing that the fact store cannot support.

Twelve-month sequence. Nov–Dec 2026: demand map and price desk from existing data; pick 3 mandate targets. Jan–Mar 2027: first two sole-selling mandates; first "what to build here" report. Apr–Jun 2027: JV facilitation offer to landowners from the likely-to-list engine; first JV documented. Jul–Sep 2027: second JV; site chosen for the boutique co-development from the demand map; pre-sales list built. Oct 2027: term sheet with the construction partner; bookings opened to matched buyers. By Oct 2028: first project delivered into the passport and management lines.

15. International watchlist and the untouched ideas

What shipped in the last twelve months that a firm like 3 PIN must measure itself against, and the ideas nobody in Chennai has touched. Each row ends with what 3 PIN does about it.

15.1 Releases to compete with (Oct 2025 – Oct 2026)

Release	What it is	3 PIN's answer	Gap to close in 12 months
SERHANT. S.MPLE 2.0 / Dot (Sep–Oct 2026)	Proactive AI chief of staff over the agent's calendar, email and CRM; 70+ agents and tools	**Eåsy by 3 PIN** (section 12)	Proactive morning plan and approval queue live by Wave 2; voice from Wave 1
Lofty AOS (Feb 2026)	"Agentic operating system": coordinated AI agents across sales, social and homeowner prospecting	Eåsy + the sourcing engine (A1–A2) + content engine (E)	Homeowner prospecting from owned data (A1) by Wave 4
Rechat "Hey Lucy", AI Memo, AI-built websites (Apr–Sep 2026)	Voice-first commands from the car; conversations captured into the CRM in real time; brokerage sites built from CRM data and *built for AI agents to read*	J2 commands; F2 calls → notes; D2 site with structured data and an `llms.txt` so AI agents read our stock	Voice commands in Tamil by Wave 1; AI-readable site by Wave 3
Compass AI Assistant / Compass One (Jul 2026)	Assistant inside the pipeline: briefings, likely-to-sell, record updates; a client portal for every stage	J4 reports, A1 likely-to-list, G3 "My 3 PIN" portal	Portal on WhatsApp first (Wave 5)
Zillow AI mode (Mar 2026), **Zillow Immerse** on Apple Vision Pro	Search by describing the home; guided next steps; spatial walkthroughs of listings	D5 "Ask 3 PIN"; C1 splat tours; a **spatial lounge** for premium and NRI buyers (15.2)	Conversational search on WhatsApp by Wave 3
Luxury Presence SEO + GEO + weekly social and paid	Agencies' content, GEO and ads produced every week by AI	D2 + E1–E3	Locality guides in Tamil and English cited by AI answers — Wave 3
AppFolio Realm-X ↔ Claude; data providers (Green Street, MSCI, ATTOM, Regrid…) publishing **MCP servers**	Property operations run from inside an AI assistant; licensed data plugged straight into Claude	K5 3 PIN MCP server; R8 data products	Owner's live-data questions answered through Claude by Wave 5; a partner-facing MCP for banks and developers after
PRYPCO Mint + Dubai Land Department (Feb 2026)	Government-backed tokenisation of title deeds; AED 18.5 M in the pilot from 50+ nationalities	L6/R-series: distribute SEBI-regulated SM REIT and fractional products; watch Indian tokenisation rules	Investor product desk by Wave 5; no custody, ever
First Street climate risk on Zillow (added Sep 2024, removed Dec 2025 after agent complaints)	Flood, wildfire, heat scores on every listing	U1 **Monsoon Score** (15.2), designed from Zillow's lesson: resilience facts, not a scare number	Wave 3, with the microsites

Release	What it is	3 PIN's answer	Gap to close in 12 months
Roam / RetroRate (assumable mortgages, $500 M sales), **Flyhomes** buy-before-you-sell, **Pacaso** co-ownership (89 % occupancy vs 39 % for owned second homes)	Finance-led proptech: new ways to afford, bridge and share homes	U7 co-ownership for weekend homes; U9 bridge for upgraders; both through regulated partners	Pilots in 2028, after the finance desk (G5) runs
Embedded insurance ($156 B → $703 B by 2029)	Cover sold inside rental, mortgage and property platforms	U8 at registration and at lease	Partner and API by Wave 5
AI property management (≈80 % of tasks automated); **construction robotics** (Monumental €27 M; 30–50 % labour savings on affected scopes); **digital twins**	Operations and building run on live data	I1 management on Eåsy; digital twin as the Property Passport for new builds (section 14)	Management line first; twins with the first co-development
India: Tamil Nadu e-registration mandatory for first sales from 17 Aug 2026 (Anywhere Registration, Aadhaar biometrics, presenceless deeds); **ULPIN / Bhu-Aadhaar** rolled out; **DigiLocker** holds deeds and ECs; **Account Aggregator** (₹3.82 lakh crore of loans in FY26; 7–15-day approvals); **UPI AutoPay** mandates	The rails for remote, verified, financed transactions now exist	H2/H3 closing built on these rails; U2 NRI remote registration; U4 pre-approval in chat; I1 rent on AutoPay	All inside Waves 1–4 — this is the part competitors abroad cannot copy

15.2 Untouched in Chennai — the ideas with no local owner

#	Idea	Why nobody has it	What 3 PIN does	Benefit
U1	**3 PIN Monsoon Score** — flood resilience per listing	35.6 % of Chennai is mapped flood-prone (Semmancheri 83 %, Saidapet 74 %, Sholinganallur 74 %, Siruseri 60 % within 2 km); every buyer asks, no listing answers. Zillow learned that a bare "risk score" costs sales	A **resilience page** per property: inundation-zone status, floor level and stilt height, 2015 and 2023 history from the society, drainage works nearby, insurance options — facts with sources, never a single frightening number; the price desk uses it	Trust that converts; premium for high-ground stock; the question answered before the visit
U2	**Register from anywhere** — NRI remote closing	Mandatory e-registration for first sales (Aug 2026) and presenceless deeds exist; nobody packages them	A fixed-fee service: documents in DigiLocker, Aadhaar-based remote attestation, slot and liaison by the transaction agent, video walkthrough of the flat the day before	The NRI desk's anchor product (R9); closings in weeks from abroad
U3	**Property Passport on DigiLocker**	DigiLocker already stores deeds, ECs and tax receipts; no agency builds the owner's wallet around it	Every verified listing and managed unit gets a passport: documents, ULPIN, measurements, tour, valuations, maintenance; transferable at sale	The record that makes 3 PIN the lifetime agency (R2)
U4	**Pre-approval in chat** via Account Aggregator	Banks approve in 7–15 days through AA; brokers still send buyers to branches	Consent-based pre-approval inside WhatsApp with the DSA partner (G5)	Financeable buyers at every visit; loan income
U5	**Spatial lounge** for premium and NRI	Vision Pro listing apps exist (Zillow Immerse, Rocket Homes); Chennai has no spatial showroom	One headset in the office and a loan set for premium sellers' living rooms; splat tours and JV project twins viewed at full scale; remote sessions for NRIs	Premium listings choose 3 PIN; fewer flights for NRI buyers
U6	**AR staging on site** for JV and boutique projects	Developers sell from brochures; AR staging at the site (R2U's model) is used by large developers abroad	Pre-sales on the plot: the buyer stands on the site and sees the flat at full scale	Bookings before ground-break (section 14)
U7	**Co-ownership of weekend homes** (ECR, Pondicherry, Kodaikanal, Yelagiri)	Pacaso proved 89 % occupancy; Indian structures (LLP/company shares) exist; no Chennai operator	Curated homes, 1/4 to 1/8 shares, managed and booked through Eåsy; legal structure and SEBI boundary checked first	A new asset class for the same clients; management ARR
U8	**Embedded insurance**	Home, rent-default and title cover are sold nowhere in the transaction	Offered at registration and at lease signing through a licensed partner	Income per deal; safer tenants and owners
U9	**Buy-before-you-sell bridge** for upgraders	3BHK demand up 15 %; upgraders are stuck selling first	A bridge product with an NBFC partner, sized from the price desk	Unlocks upgrader deals (two transactions each)

#	Idea	Why nobody has it	What 3 PIN does	Benefit
U10	**Tokenised and fractional distribution**	SM REIT framework live; tokenisation rules forming	Distribute, never custody; a watch brief on DLD-style tokenisation	Investor product line
U11	**Websites built for AI agents**	Portals optimise for Google; nobody for ChatGPT/Gemini agents	`llms.txt`, structured data, verified facts, Tamil and English locality guides (D2)	Cited in AI answers; organic leads
U12	**Senior and NRI-parent living**	Managed rentals with care partners do not exist here; demand from NRIs is constant	A managed-rental tier with care, maintenance and reporting partners (I1)	Recurring, high-trust revenue
U13	**Construction robotics and digital twins**	Boutique builders use neither	For the co-developed projects: twin from design to passport; robotics via the construction partner where it pays	Faster, documented builds; the passport from day one
U14	**Rent-to-own — avoided**	Divvy's predetermined-buyback model collapsed when rates rose	Only managed rental with a first right to buy at the then price-desk value, never a fixed future price	The benefit without the balance-sheet risk

15.3 How 3 PIN compares at international level — the twelve-month target

Capability	World's best today	3 PIN in 12 months (plan reference)
Proactive AI staff	SERHANT Dot, Compass AI Assistant	Eåsy: ask + act + anticipate, Tamil and English (12)
Conversational search and guided next step	Zillow AI mode	Ask 3 PIN on WhatsApp; visit booked in the same chat (D5, G1)
Immersive listing	Zillow Showcase/Immerse, Matterport splats	Splat tour + microsite + Tamil narration on every exclusive (C1, C3, C5)
Seller prospecting	Lofty AOS, SmartZip/Offrs	Likely-to-list from owned data + Chennai records (A1)
Verification and closing	Landeed, AppFolio + Claude, TN e-registration	Verified badge, passport, remote registration (B2, U2, U3)
Recurring revenue	NoBroker management, embedded insurance	Management + loans + insurance + value reports (I)
Development intelligence	PropEquity, Liases Foras (metro level)	Street-level demand map feeding mandates and JVs (14)
Data openness	MCP servers from data providers	3 PIN MCP for the owner, then for partners (K5, R8)
